

TERRA TREAT™ MODE OF ACTION

TERRA TREAT™ IN WATER AND/OR FERTILIZER OR PESTICIDES

- * Terra Treat™ is designed to reduce the cohesive tension of water.
- * After the water and Terra Treat™ is combined, Terra Treat™ settles to the bottom of spray droplets on/or in the soil.
- * As the water droplet reduces in size in the soil, the droplet flattens out with Terra Treat™ in it.
- * Terra Treat™ does not diminish in size but flattens out laterally increasing penetration and infiltration through the colloidal particles of soil breaking cohesive tension.
- * Once the cohesive tension of water is reduced, even lateral distribution of water becomes evident.
- * Water, fertilizer, pesticides, such as metam sodium and soil amendments are all moved evenly beneath the soil surface when Terra Treat™ is included at 1-2 pints per acre.
- * Terra :Treat is economical at suggested grower price of \$8.50/Quart. Use 2-3 pints/Ac. 2 or 3 times per crop. A second application at 1-2 Pints/quart/acre may be required under highly compacted conditions or low moisture availability.
